Let's Start!

Getting to Know the Open Source Movement

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Ask your partner:

- What do you know about free license software?
- What kind of open software projects do you know?

Can Do Statements:

- I can explain what the open source movement is.
- I can identify concepts and information related to the open source movement.
- I can obtain information about the open source movement.

Let's Explore!

Two friends talk about Open Source Movement.

Instructions: Read the text below.

John: Hey, what are you doing?

Hanna: I'm reading about the Open Source Movement. Do you know something about it?

John: No I don't, this is the first time I hear about it.

Hanna: Would you like to learn about it?

John: Yeah, it sounds interesting

Hanna: Well the Open Source Movement is an organization that promotes and supports the usage of free license software.

John: So, they promote the acquisition of software without paying it for it, and without the limitation of copyright.

Hanna: It's even more than that, the open source goes beyond the mere acquisition of the software, but the freedom to access and modify its code, so it allows users to work on it to fix mistakes, add some features and create variations of a piece of software.

John: When was its creation?

Hanna: In 1998 by Eric S. Raymond. There were other cofounders but Raymond connects the most with the movement because he's the main theorist on the matter. Anyway, he doesn't like to consider himself as the one and only leader.

John: What are the accomplishments they got so far?

Hanna: Well, they established the Open Source Initiative, which is the administrative organization of the movement, and they got the attention of some software development companies, which helped some open source software to gain recognition, Linux is a good example of it. They're also, along with the SFS one of the main defenders of the hacker community.

John: Wow, they're totally awesome. I didn't know a thing about them but now, I definitely want to get to know some of that kind of software. Don't you want to do the same?

Hanna: Of course, in fact, would you like to go to the computer lab right now? They just installed Linux on the computers.

John: Let's go.

**Let's Practice!**

Now, John gives some information about the Open Source Movement.

Instructions: Read the question. Select all the correct answers.

What isn't true about the Open Source Movement?

1. ___ It doesn't promote the usage of free license software.
2. ___ It promotes the acquisition of software without paying for it.
3. ___ It allows users to fix mistakes on software.
4. ___ It doesn't allow the users to modify software codes.
5. ___ It didn't get the attention of some software companies.
6. ___ Eric S. Raymon created it in 1998.

**Let's Practice!**

Let's check some important concepts related to the Open Source Movement.

Instructions: Read the clues. Complete the crossword.

Down

2. This company doesn't have the limitation of _____.
4. The organization got the attention of some software _____ companies.
5. This is a company that also allows users to add _____ to a piece of software.

Across

1. Open Source Movement is an _____ that supports the usage of free license software.
3. It allows to access and _____ the software codes.
6. It is one of the main defenders of the _____ community.

Extension Activity

Make your own concept map about the Open Source Movement.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about the Open Source Movement.
- Design a concept map explaining the important aspects of the Open Source Movement.
- Show your concept map with your classmates and discuss it.

Self-Assessment

Yes No

- I research about the Open Source Movement. ☐ ☐
- I create a concept map to show the relevant characteristics of this company. ☐ ☐
- I share my ideas about the Open Source Movement with my classmates through a concept map. ☐ ☐

Target Words

- **movement** (noun): group of individuals that share a common interest and work together to achieve it.
e.g. There were other cofounders but Raymond connects the most with the movement because he's the main theorist on the matter.
- **accomplishments** (noun): something achieved in a skillful way.
e.g. What are the accomplishments they have achieved?
- **Hacker** (noun): an individual with advanced knowledge and skills on computer programming and software development.
e.g. They're also, along with the SFS one of the main defenders of the hacker community.
- **acquisition** (noun): the act of obtaining something.
e.g. They promote the acquisition of software without paying it for it, and without the limitation of copyright.
- **copyright** (noun): the ownership of something in a legal way.
e.g. They promote the acquisition of software without paying it for it, and without the limitation of copyright.
- **feature** (noun): a relevant characteristic of something.
e.g. It allows users to work on it to fix mistakes, add some features and create variations of a piece of software.

Learning Points

Common Auxiliary Contractions

Auxiliary contractions are short words formed when we link the auxiliary verb and either a pronoun or the particle not. We use them in every day speech and informal writing.

In the English language, there are certain auxiliaries that have contracted forms. In this occasion, we will focus on the contracted auxiliary forms of the simple present, present continuous, and simple past tenses.

In the **simple present** and the **present continuous**, we use contractions with the verb to be in the following cases:

When we use the affirmative form of the **verb to be**:

am = **'m**

is = **'s**

are = **'re**

Examples:

*I**'m** a software developer.*

***He's** currently working on an open source project.*

*They**'re** in charge of the project.*

With the negative and interrogative form of the **verb to be**:

is + not = **isn't**

are + not = **aren't**

Examples:

*He **isn't** currently working on an open source project.*

*They **aren't** software developers.*

***Aren't** you a software developer?*

***Isn't** he studying for the programming test?*

When we use other verbs different from the **verb to be** in the **simple present**, we use the auxiliary verbs **do** and **does** in contracted form with the negative and the interrogative forms:

do + not = **don't**

does + not = **doesn't**

Learning Points

Examples:

Open source Software **doesn't** have copyright restrictions.

Copyright holders **don't** limit the purposes software can be used for.

Don't you know how open source software works?

For the **simple past**, we stick to the same rules as in the simple present. With the **verb to be** in past form, we use contractions in negative and interrogative sentences:

was + not = **wasn't**

were + not = **weren't**

Examples:

He **wasn't** aware of what an open source project was.

They **weren't sure** about the concept of open source software.

Weren't they software developers?

When we use other verbs different from the verb to be in the **simple past**, we use the auxiliary **did** in contracted form with the negative and the interrogative forms:

did + not = **didn't**

Examples:

He **didn't** know anything about open source software.

They **didn't** use open source software at the time.

Didn't you know the open source movement?

Examples

- No I don't, this is the first time I hear about it.
- It's even more than that,
- I didn't know a thing about them but now I definitely want to get to know some of that kind of software.

Learning Points

Verb + infinitive: Questions with **Would like to**

In English, there are some **infinitive verbs** that are always followed by other verbs such as the verb **would like to**.

These verbs are always followed by the preposition **to** and they can express different meanings. **Would like to** refers to the desire or the intention of doing something:

- I **would like to** understand how a database software works.

You can use *verbs with infinitives* in affirmative or interrogative forms, for instance:

- I **would like to** see how to use free access software.
- **Would** you **like to** know how to use free access software?

Remember that you can use the contracted form of the verb too:

- I'**d like to** see how to code using MySQL.

There are some other *infinitive verbs* with similar meaning as *would like to* such as *want to* or

The following is the structure to make questions using **would like to**:

Would + subject + **like** + **to** + **verb in infinitive** + complement?

Example:

Would you **like to have** free access to software without any restriction?

Examples

- *Would you like to learn about it?*
- *Of course, in fact would you like to go to the computer lab right now?*

Learning Points

Open Source Software

Open Source Software is a kind of computer software with a license in which the copyright holder provides permission to thirds to study, make changes and distribute the software to any person and for any purpose.

In the following chart you have the top ten Open Source Software products.

Open Source Software	Characteristics
Apache Spark	A tool that allows users to process big datasets across many nodes, while coordinating the processing so that users can concentrate on writing their queries in their language of choice.
Blender	The Blender Foundation aims to build a free and open source 3D creation pipeline for artists and small teams.
D3	It makes easier the visualization of big amounts of data.
Dolphin	A file manager with especial features to control quickly and easily your file system.
Git	It allows to track changes to files.
Mattermost	A JavaScript based team chat system.
Piwik	An open source alternative to google analytics.
R	A programing software aimed to statistical computing and graphics.
Sugar CRM	A Tool that help organizations to manage their contacts (customers).
Vagrant	It is a software to configure and command virtual machines.
