Let's Start!

Windows and its Programs

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations.

Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can explain what Microsoft.net is.
- I can exchange information about Microsoft.net with my colleagues.
- I can identify features about Microsoft.net.

Ask your partner:

- Do you think there is any difference when you program with one language or another? Why?
- Is there anything like a good and a bad programming language? Explain.

Let's Explore!

Programming with Microsoft.Net

Instructions: Read the text below.

Trainer: Hey, welcome to the company.

Trainee: Thank you very much.

Trainer: I'm going to be your guide and trainer for today. Tell me, are you familiar with the Microsoft.Net framework?

Trainee: No, I'm not. In the company where I worked before we didn't have to use it at all. Sorry.

Trainer: You don't need to worry about it. We are helping you to get used to it during your first days.

Trainee: Thanks a lot, I really appreciate it.

Trainer: Since all of our computers work with the operating system Windows 7, we don't need to use other programming platforms, our development department only uses Microsoft.Net. Microsoft.Net is a consistent programming platform that allows a wide but clear set of solutions to all the needs that programming and managing applications may have.

Trainee: It seems to be very practical.

Trainer: Yeah, it is, its versatility allows programmers to use codes from different programming languages without major complications, and we know this feature as Language Interoperability. Also, there are programs written for Microsoft.Net framework executed within a software environment called Common Language Runtime, an application that provides different services like memory management. It also includes the Framework Class Library, a large library that gives the most useful and essential collection of reusable classes, interfaces, and value types.

Trainee: Wow, I think that's a lot of information, and honestly, I didn't understand it very well.

Trainer: You don't have to worry about it. I bet you can learn much better by actually getting to use Microsoft.Net.

Trainee: Sure, there is an opportunity to get familiar with it and understand better how to use it.

Trainer: Ok, follow me. She is Carol. Carol understands perfectly how this works, she can help you.

**Let's Practice!**

Jared, the IT manager, is explaining to the new person why .Net Framework is important for the company.

Instructions: Select the best option to complete each sentence.

We (did have / doesn't have / don't have) to use other framework solutions to design programs in windows; .Net Framework is more than enough, as it provides all the necessary tools and codes to build outstanding apps. However, in the company where I worked before, we (didn't / aren't / doesn't) have to use Microsoft.Net at all, as we were working with Linux based programs, but since all of our computers work with Windows, we (don't need to / haven't / doesn't need to) use other programming platforms.

**Let's Practice!****All about Microsoft.Net**

Instructions: Select the correct answer.

1. When you talk about Microsoft.Net, you are _____ to a programming platform.
(Hint: Remember you are using the auxiliary verb "to be")
 - a. referring
 - b. refers
 - c. referred
 - d. to refer
2. Microsoft.Net _____ programmers to use different programming languages such as, C# or C++, to build software with in its framework.
(Hint: Is the sentence expressing a generality or an ongoing action?)
 - a. allow
 - b. allows
 - c. allowance
 - d. allowing
3. _____ some .Net Framework's features that allow the programs run within windows.
(Hint: We are talking about some!)
 - a. there is
 - b. are there
 - c. is there
 - d. there are
4. Common Language Runtime is a feature that _____ the app with different services, like memory management or specific code to run within windows.
(Hint: Pay attention to the first verb.)
 - a. provides
 - b. provide
 - c. providing
 - d. to provide
5. This is the last version of Microsoft .Net Framework, this time they are _____ an update in the Framework Class Library, which _____ an essential collection of reusable classes, interfaces, and value types.
(Hint: What time tenses do you think we are using here?)
 - a. including - gives
 - b. includes - giving
 - c. includes - gives
 - d. included - gave

Extension Activity

It's time for you to show how much you know about Microsoft .Net Framework.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for extra information regarding .Net Framework.
- Write down a list where you state the pros and cons of implementing .Net Framework over other programming languages.
- Use don't have/need to and ideas in present and past to explain your list.
- Share your findings with your classmates and instructor.

Self-Assessment

Yes No

- I do further research about Microsoft .Net Framework. ☐ ☐
- I write a list stating the pros and cons of using .Net Framework over other options. ☐ ☐
- I make use of the grammar of the level to express my ideas. ☐ ☐
- I share my findings with my classmates and instructor. ☐ ☐

Target Words

- **practical** (noun): something easy to be done
e.g. It seems to be very practical
- **programmer** (noun): someone who knows how to use and design different kind of software
e.g. Its versatility allows programmers to use codes from different programming languages without major complications
- **feature** (noun): special characteristics of a program.
e.g. We can say that among its many features, there are some that you must learn; for example, there is the Common Language Runtime feature that allows apps and programs run within windows.
- **framework** (noun): a structure that support something
e.g. Tell me, are you familiar with the Microsoft.Net framework?
- **clear** (adjective): something easy to identify and understand
e.g. Microsoft.Net is a consistent programming platform that allows a wide but clear set of solutions to all the needs that programming and managing applications may have.

Learning Points

Simple past vs Simple Present, Regular vs Irregular Verbs, in All Forms

You use the **present simple** tense when you are referring to facts, routines, or daily activities; on the other hand, use the **past simple** tense when an event or action happened and finished in the past.

Every time you use the **past simple** tense, you have to bear in mind that there are **regular** and **irregular verbs**.

Keep in mind that the regular verbs end with the preposition -ed, -d, or -ied depending on the termination of the verb.

Pay attention to the following charts to see how the present and the past simple work in their different forms.

Simple Past

	Subject	Auxiliary verb		Main verb	Complement
Affirmative	I			Worked	before
Negative	She	did	not	understand	Microsoft.Net
Question	Did	You		Use	It before?

Simple Present

	Subject	Auxiliary verb		Main verb	Complement
Affirmative	I			Know	The platform
Negative	She	does	not	Manage	informaton
Question	Did	They		Develop	Software

We classify the ends of the regular verbs as follows:

-d verbs end in silent **e**

Close = closed

-ied verbs end in **vowel + y**

Study = studied

cry = cried

-ed verbs are all the other regular verbs

visit = visited

show = showed

Work = worked

Learning Points

Irregular verbs, on the other hand, don't have a specific rule or classification because they change partially or totally from their base form.

In the following chart, you can find a list with some of the most common irregular verbs.

Base form	Past
Put	Put
Cut	Cut
Be	Was/were
Go	Went
Know	Knew
Do	Did

Examples

- *Tell me; did you ever work with Microsoft .Net framework in your previous job?*
- *No, I didn't. In the company where I worked before, we didn't have to use it at all.*
- *It is a consistent programming platform that allows a wide but clear set of solutions to all the needs that programming and managing applications may have.*

Learning Points

"Have to" And "Need to" to Express Absence of Necessity

You can use "**have to**" and "**need to**" in negative form to express that something is not necessary or mandatory to do.

We use "**have to**" and "**need to**" in their negative form when you want to express that something is not necessary. To do so, you have to use the following rule:

Subject + don't/doesn't + have to/need to + verb (base form) + complement.

Examples:

You **don't need to always use** .Net Framework to develop apps; however, you **don't have to change** the programming language either.

As you can see, in the previous example the use of **need to** and **have to** in their negative forms express a lack of necessity or obligation.

Examples

- *Since all of our computers work with Windows, we don't need to use other programming platforms, our development department only uses Microsoft .Net framework*
- *As I told you, you don't have to worry about it right now. In fact, I bet you can learn much more by actually getting to use Microsoft .Net Framework.*
