**Let's Start!**

CASE: a Domain of Software Tools!

**Learning Outcome:**

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations.

Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Ask your partner:

- What kind of software functions do you consider essential to create an application? Why?
- What are indispensable characteristics in a tool to design software?

Can Do Statements:

- I can explain what CASE is.
- I can discuss about the risks factors related to CASE.
- I can obtain precise information related to CASE.

Let's Explore!

The special guest talks about CASE

Instructions: Read the text below.

Interviewer: Welcome to our daily show, today, we have a special guest only to talk to our audience about CASE. Our guest is the CEO at a computer software multinational.

Interviewed: Thank you for the invitation.

Interviewer: Please tell us about CASE; are there any key features? Is there a particular time for its development?

Interviewed: Well, CASE stands for Computer-aided software engineering, it started as a Project in 1968 at Michigan university. CASE is the domain of software tools used to design and implement applications and operating system software. CASE inspiration came from the computer-aided design CAD tools used to design hardware products. CASE tools serve to develop high-quality, defect-free software and maintainable only to develop and guarantee software with quality.

Interviewer: Are there any other features or precise information do you consider relevant to mention?

Interviewed: Absolutely, some other features are the design tools like flowchart or pseudocodes, these tools can work when a program and its implementation is underway, CASE tools can help the programmers maintain consistency only to provide a list of affected components. And also, we have integration and trends, in which a typical CASE environment integrates a variety of tools only to facilitate the flow of software development and data transferring.

Interviewer: What about the risk factors related to CASE?

Interviewed: Some significant risk factors for companies implementing CASE technology include inadequate standardization. Sometimes companies need to adopt methodologies and tools only to meet their specific requirements. Also inadequate training represent a risk because CASE requires time to train people in how to use the tools. Finally, CASE offers capabilities to utilize new types of tools in innovative ways, but without the guidance processes and controls these new capabilities can cause new problems.

Interviewer: We're running out of time, but thank you for joining us today.

Let's Practice!

Is there anything else we should know about CASE?

Instructions: Match the sentences from Column A with Column B.

COLUMN A

1. CASE stands for computer-aided software
2. CASE is the domain of
3. CASE tools are in charge of
4. We associate CASE with
5. CASE creators are allowing designers
6. CASE developers are ensuring a disciplined

COLUMN B

- a. ...software tools that companies are implementing in the operating system software.
- b. ...the methods that some companies are using with automated tools.
- c. ...analysis of detailed codes specifications.
- d. ...develop high-quality software that engineers are applying in the companies these days.
- e. ...engineering that we're using today to design applications.
- f. ...to share a common view of each project stage.

Let's Practice!

The guest explains what CASE is.

Instructions: Write the words to correctly complete the sentences. Use words from the box below. Read the sentences aloud. Check the pronunciation with your instructor.

Word Bank

we're using today / are applying / are implementing /
are ensuring / are allowing

1. CASE stands for computer-aided software engineering that _____ to design applications.
2. CASE is the domain of software tools that companies _____ in the operating system software.
3. CASE tools are used to develop high-quality software that engineers _____ in the companies these days.
4. CASE creators _____ designers to share a common view of each project stage.
5. CASE developers _____ a disciplined analysis of detailed codes specifications.

Extension Activity

Now it's your turn to find more information about CASE software

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find information about the implementation issues of the Computer-aided software engineering (CASE) in a company.
- Select the most important information.
- Organize the information in a mind map.
- Explain to your partner the most important issues and the reasons for using CASE in a company.

Self-Assessment

Yes

No

- I deepen my knowledge about CASE.
- I organize important information in a mind map.
- I support ideas about the use of CASE in companies.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **consistent** (adjective)
that always is behaving in a similar way regularity, or with continuous features especially positive
e.g. CASE tools can help the programmers maintain consistency only to provide a list of affected components.
- **without** (preposition)
not having something' or 'lacking something
e.g. without the guidance processes and controls these new capabilities can cause new problems.
- **risk** (noun)
the probability of getting hurt or damaged
e.g. what about the risk factors related to CASE?
- **run out** (phrasal verb)
to manage the available amount of any source
e.g. We're running out of time but thank you for joining us today.
- **domain** (noun)
a set of websites on the internet that end with the same letters
e.g. CASE is the domain of software tools used to design and implement applications and operating system software.
- **inadequate** (adjective)
not good enough or too low in quality
e.g. Also inadequate training represent a risk because CASE requires time to train people in how to use the tools.

Learning Points

There is and There are in questions

We use "**there is**" and "**there are**" to say that something exists. We use "**there is**" and "**there are**" when we first refer to the existence or presence of someone or something.

How to use **there is** and **there are**:

- We use "there is" for **singular** and "there are" for **plural**.
- Use "there is" with uncountable nouns.
- The contraction of "there is" is **there's**. But you **cannot** contract **there are**.

Questions with **there is** and **there are**.

To form a question we have to place "is" or "are" before "there". Which means we use the verb **to be** first and "there" right after it.

For example:

Is there a new manager in the company?

Are there any programs to design facades?

Examples

- *Please tell us about CASE; are there any key features?*
- *Is there a particular moment when it emerged?*
- *Are there any other features or precise information you think that's relevant to mention?*

Learning Points

Infinitive to Talk about Unexpected Events with Only

The infinitive is the base form of a verb and we use it to express the purpose of something or someone's opinion or feeling about something.

The infinitive form of a verb is its basic form. When you use the infinitive you can use "only" to reinforce the meaning of the verb in order to express that something is limited to a subject, an object, an amount or an activity.

How to use "only" with infinitives:

Sometimes "only" is used before the **infinitive**.

Use "only" to **emphasize** on the limitations or particularities of the action.

"Only" focuses on the specific **purpose of the action**.

Examples:

*We need to use this new software **only to design** architectural models and constructions.*

*The software designers are creating new programs **only to gain** more reputation in the market.*

Examples

- *Sometimes companies need to adopt methodologies and tools **only to meet** their specific requirements.*
- *We have integration and trends, in which a typical CASE environment integrates a variety of tools **only to facilitate** the flow of software development and data transferring.*
