Inside Software Programming

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations.
Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can explain what pseudocode is.
- I can exchange information about pseudocode with my colleagues.
- I can identify information and concepts related to pseudocodes.

Ask your partner:

- What do you think the most difficult part of programming software is?
- How do you avoid ambiguity when programming software?

Let's Explore!

Lucas and Sam talk about pseudocode.

Instructions: Read the text below.

Luke: Hi Sam

Mary: Hey Luke, how are you today?

Luke: In fact, I'm thinking deeply about something.

Mary: And why is that?

Luke: Well, to be honest, I'm rarely paying attention to lectures these days, so I have no idea about yesterday's one on programming languages.

Mary: So, what did you do those two hours?

Luke: At 10:00, I am usually sleeping because I feel too tired.

Mary: You're always falling asleep during lectures.

Luke: I know. Anyway, do you mind telling me how it was?

Mary: Not at all. Well, the lecture was mainly on pseudocode.

Luke: Pseudocode, what is that?

Mary: As you know, it doesn't matter how much technology advances, even the most sophisticated computer can never get to the level of the human mind. A proof of it is that programming languages are still very basic if we compare them with human language.

Luke: That's amazing, even though sometimes they can be way too difficult to learn.

Mary: True! Programming is frequently using a simplified language. That's the pseudocode, a language that is more natural and readable than any other programming language, but it has a solid structure that avoids ambiguity.

Luke: How do you write it? Did you take notes of any example?

Mary: Of course! You just have to include the basic structure from any programming language. Then, once you checked that the writing in the pseudocode is correct, you have to recode it in any programming language you want. This pseudocode can determine the way to charge sales tax for an online purchase.

Getting the customer's state

If state is "CS" then

Tax = Price * .075

Total = Price + Tax

End If

If (state == "CS") {

Tax = Price * .075;

Total = Price + Tax;

Luke: Wow! It looks pretty complex!

Mary: Not at all, think of it as an easier way to program but keeping in mind the inside process!

Luke: Got it!

Let's Practice!

Sam and Luke are talking about Pseudocode class.

Instructions: Proofread the sentences. Correct the mistakes according to what you read in the text above. Check your answer with your partner.

1. To be honest, I'm almost always paying attention to lectures these days.
2. At 10:00 I am usually sleeps, because I feel too tired.
3. Anyway, programming is never using a simplified language.
4. The pseudocode is never determining whether to charge sales tax for an online purchase.

Let's Practice!

Sharing Basic Facts about Pseudocode

Instructions: Circle the correct answer. Read the sentences aloud. Check your pronunciation with your instructor.

Extension Activity

Let's look up for more information about pseudocode.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about pseudocode.
- Identify important aspects of pseudocode in programming.
- Make a brochure to write the main aspects you found.
- Share the brochure with your partner.

Self-Assessment

Yes No

- I search for information about pseudocode. ☐ ☐
- I identify important aspects of pseudocode in programming. ☐ ☐
- I make a brochure with pseudocode information. ☐ ☐
- I talk about pseudocode in programming. ☐ ☐

Target Words

- **lecture** (noun)
a speech delivered in front of a big audience with academic purposes
e.g. Well, to be honest, I did not pay attention to yesterday's lecture on programming codes.
- **technology** (noun)
applying of science and engineering together in practical uses
e.g. It doesn't matter how much technology advances, even the most sophisticated computer can't get to the lever of the human mind.
- **sophisticated** (adjective)
an object developed with full of knowledge
e.g. It doesn't matter how much technology advances, even the most sophisticated computer can't get to the lever of the human mind.
- **simplified** (adjective)
something turned into a more basic version of itself
e.g. Anyway for programming it is necessary to use a simplified language.
- **ambiguity** (noun)
that can lead or can be understood in two different senses
e.g. That's the pseudo code, a language that is more natural and readable than any other programming language but it has a solid structure that avoid ambiguity.
- **language** (noun)
a communicative system of symbols
e.g. You have to include basic structure from programming languages.

Learning Points

Wh Questions with Auxiliaries in Both Present and past, Be - Do

When we use **wh-word** for a question, it immediately becomes an open question since the answers are not anymore to yes or no.

When you make **wh-questions**, you put the **wh-word** first, at the very beginning of the sentence, then you follow the typical question structure:

Wh word + auxiliary verb + subject + main verb + complement +?

Examples:

Where do you use pseudocode?

When did you learn to write programs in pseudocode?

Remember that verb to be works as its own auxiliary.

Why are you interested in pseudocode?

Wh-questions can be formed with all tenses following almost the same structure.

Examples

- *What did you do those two hours?*
- *How do you write that kind of code?*

Learning Points

Adverbs of Frequency with Present Continuous

You use **adverbs of frequency** to talk about the rate of occurrence in which you do certain activities. Remember that **adverbs** have different levels of **frequency**.

Adverbs of frequency usually go before the main verb of a sentence. Take a look at the structure:

Subject + adverb + main verb

*I **always** remember to use programming codes when designing a web page.*

*He **normally** uses pseudocode at work.*

An **adverb of frequency** goes **after** the verb **be**. The structure goes like this:

Subject + to be + adverb

Example:

*Most of the programming codes are **never** like human language.*

*Pseudocode isn't **usually** complicated*

The structure with **present continuous tense** goes like this:

Subject+ to be + adverb+ verb+ ing+ Complement.

Example:

*The company **is occasionally thinking** in improving the language programming codes when starting the month.*

Adverb Word	Frequency Percentage
Always	100%
Frequently	90%
Usually	80%
Often	70%
Sometimes	60%
Occasionally	50%
Seldom	40%
Rarely	30%
Never	20%

Examples

- *You're **always** falling asleep during lectures.*
- *At 10:00, I am **usually** sleeping because I feel too tired.*
- *I'm **rarely** paying attention to lectures these days.*
