## CONTENT

- Let's Start! • Let's Explore! • Let's Practice! • Extension Activity • Target Words • Learning Points

### Let's Start!

Let's get into the world of software.

#### Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations.  
Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

#### Ask your partner:

- How do you think flash animations are created?
- How is it possible to embed a small program into a bigger one?

#### Can Do Statements:

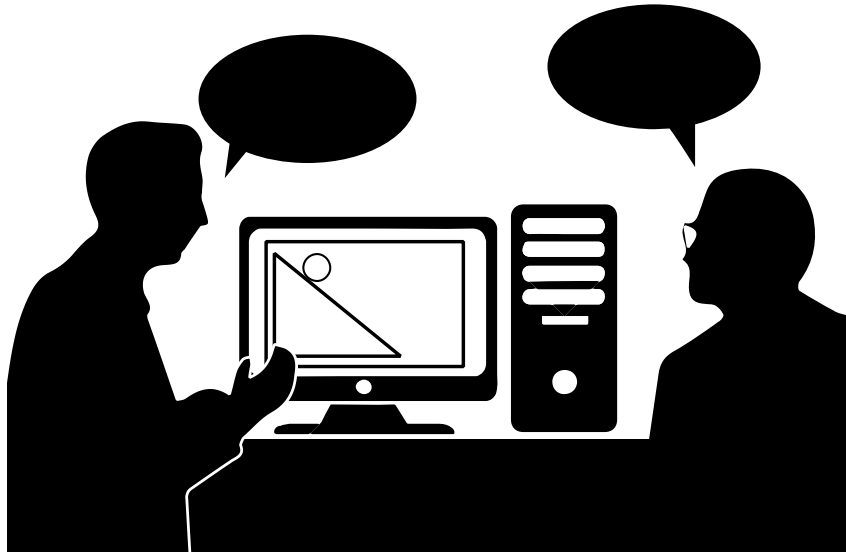

- I can explain what an applet is.
- I can exchange information about applet.
- I can identify features related to applets.

## Let's Explore!

Kent and Sheldon are discussing interesting facts about applets

*Instructions: Read the text below.*

- Kent:** This new game in this social network is awesome. Let me show you. Look, I wonder how these people can create such an excellent game.
- Sheldon:** Let's see. This game is basically made with a software component called applet. I'm currently studying this topic in my software programming course. An applet is a small program which uses the resources of a larger program such as a web browser. The applet must run in a container that provides a host program through a plug-in. Different from a program, an applet cannot run independently.
- Kent:** I didn't know that. I guess this is a very popular software then, right?
- Sheldon:** Yes, pretty much. Actually, all larger programs are using applets at the moment. They are frequently used because they provide graphical information and generally interact with the user. Normally, There is no need of sessions in order to prevent badly or maliciously written applets and the applets are always running within a restricted or "sandbox" environment.
- Kent:** Can you tell me some common examples of applets?
- Sheldon:** Yes, I can. For example, Java, flash animations, windows media and some games designed to be played using web browsers are now utilizing applets.
- Kent:** Wow, I'm impressed. You know a lot.
- Sheldon:** Well, at college teachers made big efforts to achieve that I understood this theme. For instance, the term applet appeared in the early 1990s in connection with Apple's AppleScript for the Macintosh operating system.
- Kent:** And what can you tell me about features related to applets?
- Sheldon:** An applet usually performs a very specific function without an independent use. Applets are very useful because they run in an internet browser and usually in their own window. Also, they can be placed in an HTML page then its uses are endless.
- Kent:** Amazing. Now, I'm thinking on study about that program.

**Let's Practice!**

Let's check vocabulary related to applet.

*Instructions: Find the words in the word search below.*

1. It is the acronym for Hypertext Markup Language.  
h\_\_\_\_\_
2. synonym of functional  
u\_\_\_\_\_
3. It is a software component  
a\_\_\_\_\_
4. The program where the applet runs  
c\_\_\_\_\_
5. Restricted environment where the applet runs  
s\_\_\_\_\_

**Let's Practice!**

What is an applet?

*Instructions: Complete the sentences by writing its corresponding word. Use capital letter where necessary. Use: software, makes, browser, let's, applet.*

\_\_\_\_\_ see! This video game uses this \_\_\_\_\_ component known as  
\_\_\_\_\_ which is a program that \_\_\_\_\_ use of resources from a web  
\_\_\_\_\_.

## Extension Activity

Let's find out more about applets.

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Search for information about applet.
- Identify the main facts about applet.
- Write down a paragraph in your own words explaining what an applet is.
- Share your paragraph with your class and discuss the topic.

### Self-Assessment

Yes

No

- I search for information about applet.
- I identify the main facts about applet.
- I write down a paragraph in my own words explaining what an applet is.
- I share information and discuss the topic.

☐ ☐
☐ ☐
☐ ☐
☐ ☐

## Target Words

- **host program** (noun): is any other program that supports the applet  
e.g. The applet must run in a container that provides a host program through a plug-in.
- **restricted** (adjective): with limits and security  
e.g. Normally, There is no need of sessions in order to prevent badly or maliciously written applets and the applets are always running within a restricted or "sandbox" environment.
- **HTML** (noun): Hypertext Markup Language. The language for modeling documents and the way in which the information is presented to people  
e.g. Applets run in an internet browser and usually in their own window or in a HTML page then its uses are endless.
- **interact** (verb): to participate with a user through all the options a program has  
e.g. Actually, all larger programs are using applets at the moment, because they provide graphical information and generally interact with the user.
- **useful** (noun): something that has lots of functionalities and serves different purposes  
e.g. The applets are very useful because they run in an internet browser and usually in their own window.
- **container** (noun): a bigger program in which an applet runs  
e.g. The applet must run in a container that provides a host program through a plug-in.

## Learning Points

### Simple Present vs Present Continuous in Affirmative

**Simple Present and Present Continuous** tenses are frequently used in English. Both express actions, schedules, arrangements or facts in present, but each one has specific usages and structures.

- We use the **Simple present tense** to mention daily activities, schedules, habits, general truths, routines and frequent actions.
- We use the **present continuous tense** to talk about actions that are happening at the present time and activities that are taking place right now. Take a look at this:

*I study software programming. (It shows a recurrent activity).*

*I am studying software programming this semester. (It shows that the person is doing the action in this present moment).*

As you can see both tenses are different in terms of meaning and structure.

In the **simple present affirmative** statements with the pronouns he-she-it, you add to the verb **-s ; -es ; -ies**

*For example: She works; It goes; He studies*

**The present continuous** statements don't use any auxiliary verbs. Analyze the following chart to understand differences in structure:

| SIMPLE PRESENT           | PRESENT CONTINUOUS                                                 |
|--------------------------|--------------------------------------------------------------------|
| Affirmative:             | Affirmative:                                                       |
| Subj + verb + complement | Subj + verb to be (present) + main verb (gerund -ing) + complement |

### Examples

- *I'm currently studying this topic in my software programming course.*
- *All larger programs are using applets at the moment.*
- *The applets are always running within a restricted or "sandbox" environment.*

## Learning Points

### The Infinitive Without To after Certain Verbs Let – Make

In English, it is kind of common to use the **infinitive** without **to** after modals and certain verbs as **let**, **make** and sometimes help.

We usually use the verb **let** to make a suggestion.

*For example: Let's check this new software.*

This verb follows the next structure:

**Let + object + bare infinitive (infinitive without 'to')**

We normally use the verb **make** to force someone to do something that he or she doesn't want to do.

*For example: The teacher always makes us read long articles.*

This verb follows the next structure:

**Subject + make + object + bare infinitive (infinitive without 'to')**

### Examples

- *This new game in this social network is awesome. Let me show you.*
- *Well, at college they made me learn a lot of this theme.*
- *Let's see. This game is basically done with a software component called applet.*

### Common Collocations to Talk About Computers

**Collocations** are groups of words that usually go together to give meaning as a whole. There are many collocations in English that are often used in everyday language. Some collocations are really strict in its structure since they are always composed of certain words, some other collocations allow the use of synonyms to express the same meaning.

Here are some collocations to talk about computers:

**Go online:** to connect to a website and have access to it

**Connect to the internet:** to be ready to start surfing the net.

**Browse the web:** to check data on the web.

**Search engine:** a computer program used to search documents, information and many more things, normally on the World Wide Web.
